

Boiler Water Treatments

FST™5360 - Deposit Modifier/Slag Formation Inhibitor

FST™5360 is a specifically formulated slag formation inhibitor and ash modifier for coal and other solid fuels. It is a blend of high fusion temperature metal oxides and specific slag modifiers. The product is 100% active. It does not contain any inactive fillers.

FST™5360 slag modifier functions by modifying ash and distorting crystal structure. As a result, ash melting point and pH are raised.

GAMLENITE FM - Deposit Modifier /Combustion Additive

GAMLENITE FM is a high fusion point combustion additive, with catalyst; to reduce fouling of heat transfer surfaces, and enables operators to achieve maximum boiler efficiency with minimum down time. It is particularly suited for plants where fly ash, slag and bonded deposits are prevalent, and assists in the reduction of soot. It helps reduce the problems associated with acidic deposits, particularly in economisers and flues.
